Design of Experiments - DOE

Impeller Hub Run Out

1. Weld size
2. Number of tack welds
3. Size of tack welds

3 Factors

2 Positions

Requires 8 Tests

This is known as a

Full Factorial Design

1	1	1
1	1	2
1	2	1
1	2	2
2	1	1
2	1	2
2	2	1
2	2	2

There Is A Better Way !

An Orthogonal Array

For this Experiment we would use a L4 array

This allows 4 Tests to determine the same results

4 Tests vs. 8 Tests

This works because an orthogonal array is balanced meaning that interaction are balanced between columns

1	1	1
1	2	2
2	1	2
2	2	1

What if you want to test more factors?

Seven factors would lead to **128** tests in a full factorial experiment!

An Orthogonal Array known as a L8 will give you the results required in 8 tests!

HOW DO YOU DO THIS ?

WHERE DO YOU START ?

WHO DO YOU CALL ?
